### Long Island Sound

Long Island Sound is a shallow bay in the northeastern part of our country. It is a long, narrow body of water about one hundred miles long and twenty-one miles across. Like all bays, Long Island Sound is a place where rivers and streams meet an ocean. The tide at Long Island Sound brings twenty-five billion gallons of saltwater into the bay twice each day. Three rivers bring most of the freshwater into the bay. Long Island Sound is home to many different animals and plants that like to live in water that is part fresh and part salty.	11
If you visited Long Island Sound, you would discover a busy place. Fishermen in boats pass through the bay on their way to sea. Visitors sail in sailboats and go skiing behind motorboats. With over one hundred and twenty-five different varieties of birds, the bay is also a popular place for bird watchers. Visitors also enjoy eating the delicious oysters that live in the bay. Some of these oysters are born and raised on oyster farms in the area.	112
Even though Long Island Bay is a beautiful place to visit, it has problems. One of the biggest problems is that, in some places, there isn't enough oxygen in the water during the summer. The problem is caused by fertilizers and pesticides that have washed into the bay. Because fish need oxygen to "breathe," they either die or swim away. The lack of adequate oxygen also affects plants.	124
Another problem is caused by the trash in the water and on the beaches of Long Island Sound. Animals sometimes swallow or become tangled in the trash. The trash can also get tangled up in the engines or propellers of boats.	134
